Say No To Vaccines

Children vaccinations are a very controversial topic, in today’s society. Society is progressing in chemicals and medicines day by day, which includes many pro’s and con’s. Which may vary from vaccines preventing illnesses and being a con or vaccines causing internal damage and being a con.Things are being made easier, but quality-wise, not better. Chemicals and substances are carelessly being placed into vaccines, without rationally being thought out. Many of the side effects and conditions of the chemicals are not being brought into consideration. With vaccines being loaded with toxic chemicals, this has now lead to disabilities and barriers in children’s health. The intensity of the vaccines also play a major role in the issue. As children their immune systems are meek and weak and this makes it hard for them to tolerate the impact of the intensity, of the vaccines. Vaccines have a negative impact on children because they have unnatural chemicals, cause disabilities and are too intense for children’s weak immune system.

A key reason why children should withdraw from vaccines is because they are loaded with toxic unnatural chemicals. Antifreeze, phenol (used as a disinfectant), formaldehyde (cancer causing and used to embalm), aluminum (associated with alzheimer’s disease and seizures), glycerin (toxic to the kidney, liver, can cause lung damage, gastrointestinal damage and death),
lead, cadmium, sulfates, yeast proteins, antibiotics, acetone (used in nail polish remover) (Sarah, 1). These substances can be respiratory irritants. Aluminum is a very popularly used chemical in vaccines. Aluminum is used in some vaccines and excess aluminum in human bodies can cause neurological harm (Procon, 1). Formaldehyde, also found in some vaccines, is a carcinogen, and exposure can cause side effects such as cardiac impairment, central nervous system depression, "changes in higher cognitive functions," coma, convulsions, and death (Procon, 1). With the large range of toxic, unnatural chemicals implanted in each vaccine, imagine the harm that can be done to the human body.

The possible risk for vaccines causing disabilities and impediments, is imperative but not well recognized. The health damaging risk need to be brought to attention, to protect our society and it’s future. Vaccinations are very neurotoxic and have been associated with many neurological disorders, like encephalopathies, epilepsy, convulsions, ADD, LD, autism, mental retardation, depression, anxiety, CNS disorders, paralysis, Guillain-Barre Syndrome, nerve deafness, blindness and SIDS. The neurological disorders associated with vaccinations are diverse and numerous (Vaccines and Neurological Damage, 1). Many of these disorders were not in effect until vaccines began. The relationship of vaccinations to encephalopathies and neurological diseases have been surfacing in medical journals since the advent of mass vaccination programs. Autism was unheard of before vaccinations and parallel mass vaccination programs very nicely. ADD and learning disorders in children are now being traced to childhood vaccinations, as well as convulsions, paralysis, and epilepsy. Brain damage is by far the most common adverse reaction associated with vaccinations (Vaccines and Neurological Damage, 1).
Studies show the percentage of more and more children being diagnosed with disabilities which they believe come from vaccines. For this most recent study, scientists collected urine samples from 54 children with autism spectrum disorders, and compared them with 115 children from the general population, 28 children with learning disabilities who attended special schools, and 42 children who didn't have autism, but had a sibling with the condition (Phillips, 1). As the years progress, the percentages and ratios of children to children diagnosed with disabilities, are drastically increasing. The rotavirus vaccination can cause intussusception, a type of bowel blockage that may require hospitalization, in about one per 20,000 babies in the United States. Long-term seizures, coma, lowered consciousness, and permanent brain damage may be associated with the DTaP (diphtheria, tetanus, and pertussis) and MMR vaccines (Procon, 1). In an interview, Mrs. Casey described the conditions of Trey (son), and the way the condition of autism has affected Trey’s behavior and demeanor. “The symptoms began to appear as he became older. Seeing the way he interacts with others around, as well as the time it takes him to process information, concerned me as a parent” says Mrs. Casey (Casey, Niki, interview). Trey’s condition of autism is very light, compared to others. The severity of these conditions may vary, depending on the child and progression of age. Spreading awareness of the damaging risk, may help lower the number of children suffering from health conditions that are related to vaccines.
The graph above represents the ratio of kids with autism, as to kids without autism, of the past few years. As shown in the graph, the rate of kids with autism increases drastically by the year. Researchers with the CDC publicly stated in 2002 that, “the number of infants dying from whooping cough is rising, despite record high vaccination levels.” In 2009, The Atlanta Journal-Constitution recognized the trend too. In the article titled, “Whooping Cough Vaccine not as Powerful as Thought,” the publication highlighted a recent cluster of 18 whooping cough-infected students. Seventeen of those students – 95% of those infected – had been immunized with five doses of DTaP vaccine(Ellison,1).
The strength and stability of children’s immune system is not considered. The vaccines being injected into children, are too intense for their weak immune systems. Especially being that each child has a different tolerance level, so what might be good for one child, may be harmful to another. Vaccines can cause serious and sometimes fatal side effects. According to the CDC, all vaccines carry a risk of a life-threatening allergic reaction (anaphylaxis) in about one per million children (Procon, 1). This goes to show how it can affect each child differently. In addition, vaccinations may not be good for a child's immune system, because perhaps it needs to be stimulated with these childhood infections to become strong (Hubbard, 1). With natural immunity, the immune system has time to build up to be just as strong, if not stronger. Vaccines are unnatural, and natural immunity is more effective than vaccination. Even pro-vaccine organizations state that natural vaccination causes better immunity. The Children’s Hospital of Philadelphia notes that "It is true that natural infection almost always causes better immunity than vaccines. Whereas immunity from disease often follows a single natural infection, immunity from vaccines occurs only after several doses" (Procon, 1). Vaccines actually weaken the immune system. They do not give the immune system a chance to develop on its own. It basically forces the immune system to mature faster, than it is naturally supposed to. Not only does this weaken the immune system, it renders many vaccines ineffective (Ellison, 1). It has also been shown that some vaccines have been put into place to avoid an illness, but has turned out to create another illness. "I am not saying that all vaccines don’t work," he says. "I know some of them do. "For instance, the chicken pox vaccine has clearly lowered the incidence of chicken pox," Dr. Brownstein says. "However, is that a good thing? I am not sure it's so good, since shingles cases have skyrocketed since the mass vaccination of chicken pox was started. And it was known from
the start of the chickenpox vaccine that chickenpox vaccinations resulted in an increased rate of shingles (Hubbard, 1). Therefore parents should carefully consider vaccinating their children.

Vaccines are loaded with toxins that are unnatural and cause internal damage. They also put children at physical and mental health risk. With these vaccines children are at risk of developing Encephalitis, Ataxia/Apraxia, Retardation, Meningitis, Paralytic polio, Ms Gullain Barre Syndrome, Lupus, Hyperactivity - ADD, Demyelization diseases, Auto-immune Diseases, Epilepsy, Convulsions, Seizures, Blindness, Deafness, SIDS, Epilepsy, Mental confusion, Brain tumors (Vaccines and Neurological Damage, 1). The substances that are being used to create these vaccines, are too strong for children’s pure and weak immune system. Children would be better off allowing their natural immune system to build up. Vaccines are putting children at potential risk that can be avoided by simply disregarding the vaccines. Vaccines overall have a negative impact on the health of children. Children are our leading future and their health is significant. There will become a time when children are leading our world and therefore they are a vital necessity. Vaccines have a negative impact on children because they have unnatural chemicals, cause disabilities and are too intense for children’s weak immune system.
